the compartmentation of genetic information is a fundamental feature of the eukaryotic cell the metabolic capacity of a eukaryotic plant cell and the steps leading to it are overwhelmingly an endeavour of a joint genetic cooperation between nucleus cytosol plastids and mitochondria alter ation of the genetic material in anyone of these compartments or exchange of organelles between species can seriously affect harmoniously balanced growth of an organism although the biological significance of this genetic design has been vividly evident since the discovery of non mendelian inheritance by baur and correns at the beginning of this century and became indisputable in principle after renner s work on interspecific nuclear plastid hybrids summarized in his classical article in 1934 studies on the genetics of organelles have long suffered from the lack of respectabil ity non mendelian inheritance was considered a research sideline ifnot a freak by most geneticists which becomes evident when one consults common textbooks for instance these have usually impeccable accounts of photosynthetic and respiratory energy conversion in chloroplasts and mitochondria of metabolism and global circulation of the biological key elements c n and s as well as of the organization maintenance and function of nuclear genetic information in contrast the heredity and molecular biology of organelles are generally treated as an adjunct and neither goes as far as to describe the impact of the integrated genetic system

can quickly accomplish a solid understanding of the how and why of cellular reproduction in this book we explore how multicellular organisms grow repair tissue and pass on hereditary material by means of cell division and differentiation the emphasis is on the genetic information and its faithful and complete transmission between generations we construct a simple model of the structure and role of dna how it is translated into protein and how it is combined in sexual reproduction as in all of the ross lattner intuitivscience series diagrams are an important mode of expression parents and teachers you get one half of the book we provide solid pedagogical supports recipes and methods of presentation the unit itself is subdivided into four major sections each section will take a little more than one week to complete 1 structure and function of the plant and animal cell basic use of the microscope to observe the plant and animal cells this might be review for many students 2 the observable features of cellular reproduction which are divided into two distinct phases the first phase is cell reproduction which involves the whole life cycle of one cell the second observable phase is nuclear reproduction which is widely known as mitosis 3 reproduction at the molecular level what s going on down there during mitosis and meiosis what can go wrong 4 laboratory activities in which students examine some forms of reproduction at the end of each section is a thorough quiz
