The Future of Public Health 1988-02-01

the nation has lost sight of its public health goals and has allowed the system of public health to fall into disarray from the future of public health this startling book contains proposals for ensuring that public health service programs are efficient and effective enough to deal not only with the topics of today but also with those of tomorrow in addition the authors make recommendations for core functions in public health assessment policy development and service assurances and identify the level of governmentâ federal state and localâ at which these functions would best be handled

Communities in Action 2017-04-27

in the united states some populations suffer from far greater disparities in health than others those disparities are caused not only by fundamental differences in health status across segments of the population but also because of inequities in factors that impact health status so called determinants of health only part of an individual s health status depends on his or her behavior and choice community wide problems like poverty unemployment poor education inadequate housing poor public transportation interpersonal violence and decaying neighborhoods also contribute to health inequities as well as the historic and ongoing interplay of structures policies and norms that shape lives when these factors are not optimal in a community it does not mean they are intractable such inequities can be mitigated by social policies that can shape health in powerful ways communities in action pathways to health equity seeks to delineate the causes of and the solutions to health inequities in the united states this report focuses on what communities can do to promote health equity what actions are needed by the many and varied stakeholders that are part of communities or support them as well as the root causes and structural barriers that need to be overcome

U.S. Health in International Perspective 2013-04-12

the united states is among the wealthiest nations in the world but it is far from the healthiest although life expectancy and survival rates in the united states have improved dramatically over the past century americans live shorter lives and experience more injuries and illnesses than people in other high income countries the u s health disadvantage cannot be attributed solely to the adverse health status of racial or ethnic minorities or poor people even highly advantaged americans are in worse health than their counterparts in other peer countries in light of the new and growing evidence about the u s health disadvantage the national institutes of health asked the national research council nrc and the institute of medicine iom to convene a panel of experts to study the issue the panel on understanding cross national health differences among high income countries examined whether the u s health disadvantage exists across the life span considered potential explanations and assessed the larger implications of the findings u s health in international perspective presents detailed evidence on the issue explores the possible explanations for the shorter and less healthy lives of americans than those of people in comparable countries and recommends actions by both government and nongovernment agencies and organizations to address the u s health disadvantage

the social security administration ssa administers two programs that provide benefits based on disability the social security disability insurance ssdi program and the supplemental security income ssi program this report analyzes health care utilizations as they relate to impairment severity and ssa s definition of disability health care utilization as a proxy in disability determination identifies types of utilizations that might be good proxies for listing level severity that is what represents an impairment or combination of impairments that are severe enough to prevent a person from doing any gainful activity regardless of age education or work experience

Understanding Racial and Ethnic Differences in Health in Late Life 2004-09-08

as the population of older americans grows it is becoming more racially and ethnically diverse differences in health by racial and ethnic status could be increasingly consequential for health policy and programs such differences are not simply a matter of

education or ability to pay for health care for instance asian americans and hispanics appear to be in better health on a number of indicators than white americans despite on average lower socioeconomic status the reasons are complex including possible roles for such factors as selective migration risk behaviors exposure to various stressors patient attitudes and geographic variation in health care this volume produced by a multidisciplinary panel considers such possible explanations for racial and ethnic health differentials within an integrated framework it provides a concise summary of available research and lays out a research agenda to address the many uncertainties in current knowledge it recommends for instance looking at health differentials across the life course and deciphering the links between factors presumably producing differentials and biopsychosocial mechanisms that lead to impaired health

experts estimate that as many as 98 000 people die in any given year from medical errors that occur in hospitals that's more than die from motor vehicle accidents breast cancer or aidsâ three causes that receive far more public attention indeed more people die annually from medication errors than from workplace injuries add the financial cost to the human tragedy and medical error easily rises to the top ranks of urgent widespread public problems to err is human breaks the silence that has surrounded medical errors and their consequenceâ but not by pointing fingers at caring health care professionals who make honest mistakes after all to err is human instead this book sets forth a national agendaâ with state and local implicationsâ for reducing medical errors and improving patient safety through the design of a safer health system this volume reveals the often startling statistics of medical error and the disparity between the incidence of error and public perception of it given many patients expectations that the medical profession

always performs perfectly a careful examination is made of how the surrounding forces of legislation regulation and market activity influence the quality of care provided by health care organizations and then looks at their handling of medical mistakes using a detailed case study the book reviews the current understanding of why these mistakes happen a key theme is that legitimate liability concerns discourage reporting of errors which begs the question how can we learn from our mistakes balancing regulatory versus market based initiatives and public versus private efforts the institute of medicine presents wide ranging recommendations for improving patient safety in the areas of leadership improved data collection and analysis and development of effective systems at the level of direct patient care to err is human asserts that the problem is not bad people in health care it is that good people are working in bad systems that need to be made safer comprehensive and straightforward this book offers a clear prescription for raising the level of patient safety in american health care it also explains how patients themselves can influence the quality of care that they receive once they check into the hospital this book will be vitally important to federal state and local health policy makers and regulators health professional licensing officials hospital administrators medical educators and students health caregivers health journalists patient advocates as well as patients themselves first in a series of publications from the quality of health care in america a project initiated by the institute of medicine

this book looks at health policy through the lens of public versus private population health versus the somatic social or emotional experiences of a patient rather than presenting policy ethics as overly technical this book takes a novel approach of framing public and private health in terms of political philosophy ethics and popular examples each chapter ties back to the general ethics or political literature as applicable which are not customarily parts of the current public health curriculum the author s work on the orgcomplexity blog has touched on this subject by systemically exploring public policy issues and the tone of this book mimics the blog with an extension of the arguments

this volume presents findings of a world bank review of the existing and potential role of private voluntary health insurance in low and middle income countries and is the third volume in a series of reviews of health care financing also this volume is about managing risk not the risk of national or man made disasters but the risk of illness the developing world is plagued by many of the historical scourges of poverty infectious disease disability and premature death as countries pass through demographic and epidemiological transition they face a new wave of health challenges from chronic diseases and accidents in this respect illness has

both a predictable and an unpredictable dimension contributors to this volume emphasize that the public sector has an important role to play in the health sector but they demonstrate that the private sector also plays a role in a context in which private spending and delivery of health services often composes 80 percent of total health expenditure managing risks in the private sector begins at the household level private voluntary health insurance is merely an extension of such nongovernmental ways to deal with the risk of illness and its impoverishing effects in low and middle income countries the authors examine frameworks for analyzing health financing and health insurance they conclude that most studies are hampered by lack of data on the impact of private voluntary health insurance on broad social goals such as financial protection they find no overall consensus on the impact of voluntary health insurance on public health activities or on the quality innovation and efficiency of personal health services

debate over the effects of public versus private health care financing has been and continues to be active in both academic outlets and policy circles theoretical literature on parallel health care financing is often built on untested behavioural assumptions and the empirical evidence generally depends upon the institutional details of the specific health care systems under analysis this paper contributes to the literature on parallel health care finance by developing and executing a revealed preference laboratory experiment based on the theoretical model of parallel health care finance in cuff et al 2008 the theoretical model involves individuals in the labour force with varying severities of illness who demand health care from a limited supply of health care resources health care resources are purchased by the public sector and rationed free of charge to individuals or purchased by individuals through a private insurance market the general theoretical model is converted into a discrete experimental representation of a large scale economy where individuals are price takers the probability of receiving public health care is exogenous and the willingness to pay wtp for private health insurance is elicited from subjects the experimental design includes two within subject factors based on the theoretical model the public sector rationing rule rationing based on need or severity versus

rationing based on a random allocation and the probability of being publicly treated high versus low the experimental design also includes two between subjects treatments based on the frame of the experiment neutral frame versus health frame and on the distribution of private health insurance prices high prices versus low prices the results show the public system's allocation rule and the probability of receiving health care from the public system both significantly affect an individual's wtp for private health insurance in the predicted direction although the wtp values tend to be above the actual theoretical predictions when the public system allocates health care based on need the average wtp is lower than under random allocation a higher probability of receiving health care from the public system elicits a lower wtp regardless of how the public system allocates health care it is also found that when the public system allocates health care based on need the wtps are significantly higher under a neutral frame than a health frame
