the handbook of language mapping aims to explore the core methodological and theoretical approaches of linguistic cartography in both empirical and theoretical linguistics the spatial variation of language is of increasing interest and the visualization of language in space is therefore also of growing significance it is the precondition for correct data interpretation but how does it work what has to be considered when drawing a map and how has the problem been tackled so far this book provides answers to such questions by taking a closer look at the theoretical issues surrounding cartography and at the concrete practice of mapping the fundamental issues raised are addressed particularly well since linguistic geography is not only one of the domains with a lengthy tradition it is also one of the most progressive fields in linguistics at the same time because of their visual primacy linguistic maps directly confront the challenges of human perception and aesthetics in this context envisioning the fruits of language mapping is a fascinating and inspiring endeavor not just for experts with its accessible texts and wealth of full color images the handbook not only represents a comprehensive manual serving the interests of a variety of readers it also fills a gap in the ongoing linguistic discourse

addressing physicists and mathematicians alike this book discusses the finite dimensional representation theory of  $sl(2)$  both classical and quantum covering representations of  $u(sl(2))$  quantum  $sl(2)$  the quantum trace and color representations and the turaev viro invariant this work is useful to graduate students and professionals the classic subject of representations of  $u(sl(2))$  is equivalent to the physicists theory of quantum angular momentum this material is developed in an elementary way using spin networks and the Temperley-Lieb algebra to organize computations that have posed difficulties in earlier treatments of the subject the emphasis is on the  $6j$  symbols and the identities among them especially the Biedenharn-Elliott and orthogonality identities the chapter on the quantum group  $U_q(sl(2))$  develops the representation theory in strict analogy with the classical case wherein the authors interpret the Kauffman bracket and the associated quantum spin networks algebraically the authors then explore instances where the quantum parameter  $q$  is a root of unity which calls for a representation theory of a decidedly different flavor the theory in this case is developed modulo the trace zero representations in order to arrive at a finite theory suitable for topological applications the turaev viro invariant for 3-manifolds is defined combinatorially using the theory developed in the preceding chapters since the background from the classical quantum and quantum root of unity cases has been explained thoroughly the definition of this invariant is completely contained and justified within the text
