Industrial Radioactive Waste Disposal

1959

considers problems of radioactive waste disposal and the precautions safeguards and standards to ensure safe handling of these wastes includes numerous nongovernmental reports on the sources and types of radioactive wastes

Radiological Health Handbook

1960

in the first contribution to this volume we read that the world wide production of single crystal silicon amounts to some 2000 metric tons per year given the size of present day silicon crystals this number is equivalent to 100000 silicon crystals grown every year by either the czochralski 80 or the floating zone 20 technique but to the best of my knowledge no coherent and comprehensive article has been written that deals with the art and science as well as the practical and technical aspects of growing silicon crystals by the czochralski technique the same could be said about the floating zone technique were it not for the review article by w dietze w keller and a mihlbauer which was published in the preceding volume 5 silicon of this series and for a monograph by two of the above authors published about the same time as editor of this volume i am very glad to have succeeded in persuading two scientists w zulehner and d huber of wacker chemitronic gmbh the world s largest producer of silicon crystals to write a comprehensive article about the practical and scientific aspects of growing silicon crystals by the czochralski method and about silicon wafer manufacture i am sure that many scientists or engineers who work with silicon crystals be it in the laboratory or in a production environment will profit from the first article in this volume

this packet includes crossword like puzzles where the answers are all numeric values down and across clues are basic math problems that include numeration and measuring this is a great source for reinforcement of math skills and providing homework sheets includes answers keys

Geopotential Research Mission, Science, Engineering, and Program Summary

1986

analysis of neutral density data has made it possible to extend curves of mean density as a function of latitude and season from 90 to 120 km there is an approximate isopycnic point at 91 km above this point the density variations are reversed from what they are at 80 km in other words at 120 km the density in summer and at the tropics is lower than that in circa 1965 and in winter the density is higher the density curves have been idealized near 120 km to join at one of three points these correspond to typical summer and tropical conditions winter conditions and spring autumn conditions the summer density is 20 percent below that of the u s standard the winter density is 50 percent above the standard and the spring autumn density is 1 percent above the standard by application of appropriate theory the corresponding variations in temperature and mean molecular weight have been calculated an unexpected result of the theory is the prediction of a seasonal variation of
