mathematics is an essential ingredient in the education of a student of mathematics or physics of a professional physicist indeed in the education of any professional scientist or engineer the purpose of mathematical physics is to provide a comprehensive study of the mathematics underlying theoretical physics at the level of graduate and postgraduate students and also have enough depth for others interested in higher level mathematics relevant to specialized fields it is also

intended to serve the research scientist or engineer who needs a quick refresher course in the subject the fourth edition of the book has been thoroughly revised and updated keeping in mind the requirements of students and the latest ugc syllabus

this book focuses on probability and the bayesian viewpoint it presents basic material on probability and then introduces inference by means of bayes rule the emphasis is on statistical thinking and how one learns from data the objective is to present the basic tenets of statistical inference unique in its format the text allows students to discover statistical concepts explore statistical principles and apply statistical techniques in addition to the numerous activities and exercises around which the text is built the book includes a basic text exposition for each topic and data appendices

the third edition of this book was very well received by researchers working in many different fields of research the use of that text also gave these researchers the opportunity to raise questions and express additional needs for materials on techniques poorly covered in the literature for example when designing an inter rater reliability study many researchers wanted to know how to determine the optimal number of raters and the optimal number of subjects that should participate in the experiment also very little space in the literature has been devoted to the notion of intra rater reliability particularly for quantitative measurements the fourth edition of this text addresses those needs in addition to further refining the presentation of the material already covered in the third edition features of the fourth edition include new material on sample size calculations for chance corrected agreement coefficients as well as for intraclass correlation coefficients the researcher will be able to determine the optimal number raters subjects and trials per subject the chapter entitled benchmarking inter rater reliability coefficients has been entirely rewritten the introductory chapter has been substantially expanded to explore possible definitions of the notion of inter rater reliability all chapters have been revised to a large extent to improve their readability

this fourth edition contains several additions the main ones concern three closely related topics brownian motion functional limit distributions and random walks besides the power and ingenuity of their methods and the depth and beauty of their results their importance is fast growing in analysis as well as in theoretical and applied probability these additions increased the book to an unwieldy size and it had to be split into two volumes about half of the first volume is devoted to an elementary introduction then to mathematical foundations and basic probability concepts and tools the second half is devoted to a detailed study of independence which played and continues to play a central role both by itself and as a catalyst the

main additions consist of a section on convergence of probabilities on metric spaces and a chapter whose first section on domains of attraction completes the study of the central limit problem while the second one is devoted to random walks about a third of the second volume is devoted to conditioning and properties of sequences of various types of dependence the other two thirds are devoted to random functions the last part on elements of random analysis is more sophisticated the main addition consists of a chapter on brownian motion and limit distributions
